

Engineered Light Gauge Steel Systems

Builders, developers and owners know

Cold formed steel offers numerous advantages over alternative materials.

They also know it can cause real headaches on the job site if trusses or panels are out of spec or erectors are short on experience.

Armour Steel brings the resources, technical knowledge and experience to take complete responsibility for the engineered light gauge steel portion of your project. From material procurement to field erection and everything in between, Armour Steel has done it and done it exceptionally well. We offer:

- Pre-engineered trusses
- Factory assembled structural wall panels and curtain walls
- Floor systems – from joists to pan deck to concrete-and-steel

One Source

Your project's entire cold formed steel framing scope begins and ends with Armour Steel.

From your project drawings we'll determine material quantities, bracing and connections, then produce a complete set of shop drawings utilizing state-of-the-art software. We will procure only prime cold formed steel sections that meet or exceed CSSBI requirements and

assemble your roof trusses, wall panels and floor systems on precision framing tables and fixtures.

Our experienced fabricators know and use CSSBI approved connections and reinforcing techniques, whether it's in our factory or on your job site.

That's right – we don't just deliver, we also erect the trusses, wall panels and floor systems we build.
